Interactions on the Web of Things
A platform for providing and using WoT services

The Web Platform
The Web is a platform for decentralized applications:
• Resources must be globally identified (URI)
• Resources must provide a uniform interface (HTTP)
• Resources must use self-describing representations

REST is the style underlying these axioms of the Web

Activity Streams
Activity Streams will provide an event-oriented platform:
• Services provide representations of resource activities
• The data model is simple and extensible
• Currently developed in the W3C’s Social Web WG

Activity Streams provide the platform WoT needs

Activity Streams as the Foundation for WoT Applications

WoT Interaction Platform
